

PREVENT[®]

AIR INTAKE FILTER

PreVent[®] is designed to keep any central air unit from clogging up with outdoor debris. This includes construction dust, dryer lint, bugs, seeds, leaves or clippings that get pulled into the air conditioner.

No system modifications are needed. Simply measure unit from top to bottom for height and measure length of entire fin surface.

PreVent[®] wraps around the outside of the air intake louvers or fins of the air conditioning unit.

The filter is held in place by bungee cords included in each kit. Make sure to attach the top bungee first to hold the filter in place. Fold over excess filter. Hook bungees directly through the media.

Attach bungees at mid-height and then at the bottom.

The end result looks great and has a very low 0.02 in. w.g. resistance to airflow!

The filter is held in place across the rear end of the unit.

Excess filter material is folded under at the edges and the bungee hooks are adjusted for a snug fit. Will not interfere with electrical and gas attachments.

Monthly cleaning recommended. To clean, either remove filter or rinse in place with garden hose.

PreVent® Wrap-Around Style Air Conditioner Filters are made of UV protected electrostatic media and backed by a 5 year warranty.
